Meeting Overview

OBJECTIVE

To outline requirements for automating Sonic Group's expense and sales bill approval workflows and to explore integration options with Tally Prime and Spine.

Executive Summary

Mugdha Borate from Sonic Group met with PuchoAI representatives (Jainam and Damini) to discuss automating their manual expense and income management processes. Sonic Group currently relies on manual, hard-copy bill verifications across four stages and uses Tally Prime for accounting. They require a mobile-friendly application where coordinators can upload photos of bills. The application must use AI to extract data (including GST and narrations), route it through a four-tier approval workflow, and generate an XML file for integration with Tally, mapping transactions to specific vendor names and expense heads. Additionally, sales invoices need to be auto-generated in Tally one day prior to their due dates. Damini will confirm the technical feasibility of Tally push integrations and Spine app compatibility with Chintan, and present a UI/UX demo within 3-4 working days.

Agenda

1. Review current manual billing and approval processes at Sonic Group.
2. Discuss requirements for a mobile-based automation application with AI data extraction.
3. Determine the approval workflow hierarchy (4 stages).
4. Evaluate integration feasibility with Tally Prime (direct push vs. XML import).
5. Discuss automation of sales invoice generation.
6. Plan next steps, including a UI/UX demo presentation.

Attendees

Name	Role
damini Pucho	AI Automation Team
Mugdha Borate	Client
Jainam Pucho	Client

Key Discussion Points

- Sonic Group handles commercial space rentals and fit-outs, currently managing expenses via a slow, manual, hard-copy approval process.
- A mobile application is needed for location coordinators to photograph bills, eliminating manual scanning and data entry.
- The application requires a 4-tier approval workflow: Center Coordinator -> Head Office Coordinator -> Director -> Accounts.
- The system needs sorting capabilities (by date, vendor) and a feature to raise queries on incorrect bills.
- AI is required to read bill images, extract data like GST and narrations, and map them to correct expense heads and specific Tally ledger names (to be provided by Mugdha).
- Sales/income invoices need to be auto-generated in Tally one day before the due date based on agreement data provided by Sonic Group.
- Direct API push into Tally may not be feasible; as a workaround, the application can generate an XML file for Tally import.
- Sonic Group currently uses the Spine application and is interested in integrating it to maintain a single centralized system.

Decisions Made

1. The automated system will implement a 4-stage approval workflow.
2. If direct entry into Tally is technically unfeasible, the system will generate an XML file for data import.
3. Mugdha will provide the mapping document connecting vendor names on invoices to their respective ledger names and expense heads in Tally.
4. PuchoAI will develop a basic UI/UX mockup to demonstrate the proposed workflow.

Action Items

#	Task	Owner	Priority	Due	Status
1	**Consult with Chintan regarding the feasibility of direct data entry into Tally and integration with the Spine application.**	Damini Pucho	High	—	Pending
2	**Create a basic UI/UX mockup, record a demo, and share it with Sonic Group.**	Damini Pucho	High	3 to 4 working days	Pending
3	**Provide the mapping data for vendor names and expense heads to ensure accurate Tally ledger entries.**	Mugdha Borate	High	—	Pending
4	**Schedule the next follow-up call once the UI/UX demo is ready.**	Jainam Pucho	Medium	—	Pending

Minutes of Meeting

Discussion Summary

The meeting focused on automating Sonic Group's expense and income tracking. Mugdha explained the multi-tiered manual approval process and requested a mobile app that uses AI to extract invoice details, route them through a 4-step approval process, and integrate with Tally Prime. Damini and Jainam noted that while fetching from Tally is standard, directly pushing data might require generating an XML file for import instead. Automation of sales invoices and potential integration with the Spine application were also discussed.

Decisions Recorded

1. Adopt a 4-tier approval flow in the new application.
2. Utilize XML generation for Tally imports if direct API push is not possible.
3. Proceed with a UI/UX mockup before backend development.

Risks & Blockers

- Technical limitations regarding pushing direct entries into Tally Prime.
- Potential challenges in accurately mapping OCR-extracted vendor names to specific Tally ledgers.

Pending Items

- Confirmation from Chintan on Tally integration capabilities and Spine app compatibility.

- Delivery of the UI/UX demo.

Next Steps

- Damini to confirm technical capabilities with Chintan.
- Damini to develop and share the UI/UX demo video.
- Mugdha to review the demo and provide Tally ledger mapping data.
- Jainam to schedule the next meeting to review the demo.

Questions Raised

- Can the application push data directly into Tally for automated entry, or is XML export the only option?
- How does PuchoAI's tie-up with the Spine application work, and can it be integrated?

Follow-up Required

- Technical validation of pushing entries to Tally.
- Review of the UI/UX demo provided by Damini.
- Discussion regarding Spine application integration capabilities.

Deliverables

- UI/UX demo recording.
- Vendor/Ledger mapping document.

Timeline

Event	Date
UI/UX Presentation	Within 3 to 4 working days

Projects Mentioned

Sonic Group Expense & Income Automation | Tally Prime Integration | Spine Application Integration

Key Takeaways

- Sonic Group urgently needs to replace its manual, paper-based approval workflow with a digital, AI-driven solution.
- The solution must extract granular data from bill photos and map it correctly to Tally ledgers.
- A workaround using XML file generation will be used if direct API insertion into Tally is restricted.
- A UI/UX prototype is the immediate next step to align on the visual workflow before addressing backend complexities.

Appendix · Full Translated Transcript

Mugdha Borate	So Manas, we discussed this yesterday. Have you briefed the team on exactly what is required?
Jainam Pucho	From our side, we have our Solution Architect team here as well, Damini. Okay, so you can give her your requirements once, and she will get your UI/UX ready and present it to you in three to four working days. Then we can proceed.
Mugdha Borate	For that, okay. Okay, so hi Damini. The thing is, we have a company called Sonic Group. Here, we take commercial spaces on rent and lease them out, which sometimes includes fit-out work. Sometimes it is only fit-out and there is no rent. Okay, so these are the two or three types of businesses we have. The thing is, we want to automate our entire process. Right now, because the Director needs everything in one online access, it is happening that he has to ask for data from everyone in the operations team and the accounts team. So basically, what happens is that we have multiple locations across different states, here in Maharashtra as well as in other states. They have certain invoices at those locations, like expense bills. For the bills currently, the manual process is that the person in charge there verifies the entire bill and sends it to the coordinator here. Then the coordinator verifies it themselves. All this is happening over emails. So the coordinator verifies it manually and then hands it over to the accounts team, and then it goes to the Director. The Director approves it. After checking everything manually, every single bill—meaning there is a hard copy of the bill—after manually checking and approving the hard copy, it comes to the accounts team. Currently, the accounting software we use is Tally. Okay, we use Tally Prime, and we have taken quite good access to it, so it has all the features. Now, what we want at this stage is that for our expenses, the coordinator at that particular location will just take a photo from their mobile. They won't scan or do anything else because they don't have that much time. They have a lot of other work to do, so we don't want to increase their workload; we want to make it easier. So they will take a photo on their mobile and upload it to whatever application you provide. Okay, so if I receive an invoice for my XYZ company, it will have an approval workflow. The coordinator will approve it, then our Head Office coordinator will also approve it. Then the Director will also check and approve it online, and then it will come to Accounts, and whatever finalization is needed will be done in Accounts. Now, what I need in this is, first, it should be fully automated so that I can see all the invoices from there in that application. If my Director asks to see how many bills came on a particular day, I should be able to sort it by day. There should be some drop-down options. If it is related to a particular vendor, then I need to see how many bills have come from that vendor since we started, completely categorized by vendor. If we have raised any queries, we will put them in the application. There should be an option that if a bill seems incorrect, we can flag it and add remarks. Whatever correction or reply comes from them, it will come through that. So we want a complete system like that. And ultimately, I am telling you the future requirement. Ultimately, what is needed is that for this bill—you might need a developer for this, I don't know exactly how you guys do it—basically, AI should read this bill, create an XML or Excel file out of it, and integrate it into Tally.
damini Pucho	Okay, meaning there should be an entry made in Tally.

Mugdha Borate	At every single stage, as I just told you, this entire manual process that we are following, we have to follow it in the same way in the application, and then ultimately its entry should happen in Tally. People's manual intervention is not needed at all. Meaning, the headache I have with Tally should also be eliminated. Simultaneously, this was about expenses. Simultaneously, we have an income part. We have agreements, and we will provide you with the summaries of the agreements, you tell us how you need them. So accordingly, whatever my expected sales are from the agreement, that should also be visible to me in your application. Okay, and simultaneously, we have a due date, so exactly one day before that due date, its entry should be made and the invoice should be generated in Tally. Basically, your application needs to integrate with Tally.
damini Pucho	Okay, and will the data come from Tally for the invoices, or from the photos of the bills being uploaded?
Mugdha Borate	Data will come from the photos of the bills for the expenses. The data will be generated from that. Okay, so you will have to read what the data is. Okay, and for the invoices in Tally—meaning the sales ones—we will provide you with the data, and you will have to read it and integrate it into Tally.
damini Pucho	Okay.
Mugdha Borate	So I have told you the very basic requirements as of now. I explained exactly how the workflow happens here. Now you tell me what else we can do in this.
damini Pucho	Okay, I understand quite well. So your approval process will be at two places: coordinator and one Director.
Mugdha Borate	It will be at 4 places. Yes, there are 4 places. There is the center where it is received, then there is the HO coordinator, then the Director, and then Accounts. Okay, and after that, it should directly integrate into Tally.
damini Pucho	Into Tally, meaning whatever bill is being uploaded, it will scan it, create the data, and make an entry in Tally.
Mugdha Borate	Yes, yes, it has to show that entry. You have to tell me how your application will do it directly. It should happen with one click.
damini Pucho	Okay, that means Pucho's application will act as a bridge that connects to Tally. Yes, yes, that will be done. I will have to confirm whether the data coming from the bills can directly make an entry into Tally or not. As far as I know right now, data comes from Tally, and we can take that data and process it. But regarding making an entry into Tally, I will have to confirm once.
Mugdha Borate	Yes, yes, okay, you confirm this and then tell me what else you can offer us in this because we want to maximize automation. So whatever inputs you have, you can provide them so that we can put them in front of the Director. And if he is okay with it, then we can move forward.
damini Pucho	Okay, so I will understand your use case and see what more models we can add to make your work better, meaning more automated.
Mugdha Borate	Okay, another thing, we do have the Spine application. I think you guys also have some tie-up with Spine. So how does your tie-up with Spine work?
damini Pucho	For that, I will have to speak with Chintan sir once. Okay, alright.
Mugdha Borate	You tell me this first, and then we will look at the rest later because we actually want to keep one center. We want to keep only one application, if that is possible and how it works. But first, we need to get this working. Okay, so you let us know how it can be done, and then we will schedule a call accordingly.

damini Pucho	Okay, so I will talk to Chintan sir about this once, okay, and inform you.
Mugdha Borate	Okay Damini. So now you have understood the requirements, so next time you can build and show something based on this.
damini Pucho	Okay, I will first discuss it, confirm with Chintan sir, create a basic UI for you, record it, and share it with you.
Mugdha Borate	Yes, yes, that works. Okay fine.
Jainam Pucho	Going directly into Tally might not be possible. Yes, we can fetch, but we might not be able to export to Tally.
Mugdha Borate	Because what usually happens is an XML file gets imported into Tally. So if your application can create an XML file, then an import link is definitely possible.
damini Pucho	So we can do that, we can create an XML file. We can create an XML file from the incoming data and you guys can import it then.
Mugdha Borate	Directly into Tally, meaning we want something like it happens in one click from your application itself. We can do it from Tally too, like we can directly go into Tally and upload that file, but if it happens from your application, it's much better. Let's see how it links up, but primarily in this requirement, what I need is that if an invoice comes to me, suppose the name on the invoice is XYZ Private Limited. It is not necessary that in Tally it is also XYZ Private Limited. If it is from Bangalore, in my Tally it might be XYZ Private Limited Bangalore. So I will link that and give it to you. Meaning, which vendor's invoice is registered under which name in my books here, I will provide that to you. Okay, so the entry should come accordingly. Basically, my main concern is that if you generate the file, then that file should come exactly according to the proper heads. You need to read the GST in it, you need to read its narration, you need to read the GST rates, and according to that, those entries should come properly and fall under the correct head. Okay?
damini Pucho	Okay, and if direct entry is not possible, we can do the XML file one.
Mugdha Borate	Okay, that works. Because you will also have to read exactly which expense head it is, and the entry will go according to that. So you give me a demo first, and then we will discuss further. Okay, alright. Thank you, then Manas, let us know when to schedule the next call.
Jainam Pucho	Okay, I will discuss with them.
Mugdha Borate	Okay, thank you.
Jainam Pucho	Thank you, bye.
